

## Material transport spreading device in front of forming station

Additional pneumatic operated spreading device in front of forming station. Connected to the material transport profiles via c-shaped arms between forming station and heater.

### Your benefits

- | With this device the material can be spread before the forming station, so that the material is transported in parallel through the forming station.
- | Thus, the material is stretched uniformly in the molding process and you will get a better forming result.

### Available for machines

RDK 80 | RDKP 72g with Siemens S7 PLC
