

Condensation drip protection

For the RDM 70K and 75K we offer an option which prevents that condensed water will drip in the area of the molding unit in regions of high humidity. This is achieved by specially shielded sound absorbers above the forming unit collecting and dissipating the resulting condensate when the cooler air is blown off. We would like to offer you this option as a conversion kit!

Your benefits

- | Collected condensate will be dissipated in order to avoid a corrosion
- | Reduced problems due to rust over a long lifecycle
- | Short delivery time
- | Easy retrofit

Available for machines
