

Retrofitting Ionization before stacking

For the RDK / RDKP machines we offer an ionization device which removes electrostatic charges of the film. In particular, in the stacking process undesirable attraction or repulsion processes of the products are prevented, which allows a smooth stacking process. We would like to offer you this option as a conversion package for other machines in the product area.

Your benefits

- | Improved stacking characteristics of the products
- | Better handling during downstream process steps

Available for machines

RDK 54k | RDKP 72k | RDK 80k
